MU: HBM Demand Insane, But Midterm Jitters Hit Chips

WHAT HAPPENED

- MU slid 2.65% to $713 today, but zoom out — the stock cratered from $795 to $656 on Nov 5th (that's an 18% single-day crash) right after the midterm election results. That's the real story. The market is digesting what a new Congress means for chip policy, and MU got caught in the crossfire along with other semis.
- Headlines are flipping bullish though — Goldman called it a "screaming buy," Barron's floated a 148% upside case, and TIKR is talking about "insane" valuation (in a good way). When the sell-side piles on after a crash, that's usually smart money signaling the bottom is near.

WHY IT MATTERS

Here's what I think is really going on: the midterm results spooked the chip sector because investors are worried about shifts in the CHIPS Act funding, export controls to China, and potential tariff escalation. MU got hit harder than peers because it has the biggest China exposure among US memory makers (roughly 10-12% of revenue) and because it's a direct beneficiary of CHIPS Act subsidies for its Idaho and NY fabs. But here's the thing — the AI capex story hasn't changed one bit. Google, Nvidia, and Microsoft just dropped $26B on Anthropic, which means more data centers, which means more HBM memory (high-bandwidth memory used in AI accelerators), which is MU's highest-margin product. The selloff is political noise obscuring a demand signal that's still screaming.

POLICY & POLITICAL WATCH

Three things to watch right now: (1) The CHIPS Act 2.0 discussions — if the new Congress trims or redirects semiconductor subsidies, MU's $15B Idaho fab economics get worse. (2) China export controls — the Commerce Dept is reportedly weighing tighter restrictions on HBM sales to China, which would be a direct revenue hit but could ironically tighten global supply and boost prices. (3) Tariff talk — any renewed tariff escalation with China hits MU's cost structure since they still source packaging and testing there. Net-net, the policy environment just got MORE uncertain, which is why the stock is volatile, but the underlying demand from US hyperscalers is a structural tailwind that no policy can kill.

IS IT EXPENSIVE?

Key Data	
Price (USD)	**$713.75**
12M Price Target	**$950.00**
Upside / (Downside)	**+33.1%**

MU — Micron Technology, Inc. | November 10, 2026

PRICE OUTLOOK — SCENARIO TARGETS BY TIMEFRAME

TIMEFRAME	BULL CASE	BASE CASE	BEAR CASE
1 Month	**$820.00**	$750.00	**$620.00**
6 Months	**$950.00**	$820.00	**$580.00**
1 Year	**$1150.00**	$950.00	**$550.00**
2 Years	**$1400.00**	$1100.00	**$600.00**
5 Years	**$1800.00**	$1300.00	**$700.00**
10 Years	**$2500.00**	$1600.00	**$500.00**

WHAT'S MOVING IN THE SECTOR

HEATING UP: Financials and Energy catching bids post-midterms — classic "Republican-leaning Congress" trade on deregulation hopes and traditional energy policy. Comm Services strong on the Anthropic deal news.

COOLING OFF: Semis broadly getting hit on China/CHIPS Act uncertainty. Energy is down 6.6% on the week despite today's bounce — demand concerns creeping in.

ROTATION WATCH: Money rotated OUT of high-beta AI/semi names and INTO financials and defensive staples after the election. This is a tactical rotation, not structural — the AI capex cycle is too big to fight for long.

RELATED PLAY: If MU recovers, watch LRCX (Lam Research) and AMAT (Applied Materials) — they sell the equipment MU uses to make HBM, so they ride the same wave with less single-stock risk.

WHO'S WINNING IN THIS SPACE?

- NVDA (Nvidia): Still the king — Anthropic deal participation shows they're monetizing the AI boom from every angle.
- AVGO (Broadcom): Custom AI silicon for hyperscalers makes them the "quiet winner" — less China exposure than MU.

MU CONTEXT: MU is LAGGING its AI-hardware peers right now, down way more than NVDA or AVGO from recent highs. That's partly justified (more China/memory cyclicality risk) but partly overdone — which is exactly why Goldman is calling it a "screaming buy." Laggards in strong sectors often catch up violently.

WHAT I'D DO WITH THIS STOCK

8/10 Conviction Score

CONVICTION: 8/10 — I'm leaning in here. The selloff is political, the demand story is real, and the valuation gives you a margin of safety.

POSITION SIZE: 4-6% of portfolio — big enough to matter if the thesis plays out, small enough that a 30% drawdown doesn't ruin your year. MU is volatile; respect that.

ENTRY POINTS: Scale in. Start now at $713, add aggressively if we see $650-680 on any further macro/China headline panic. The options flow shows big put buying at $700-715 strikes, which could mean another leg down is possible short-term.

TIME HORIZON: 12-24 months. The catalyst I'm waiting for is MU's next earnings print (December) with HBM guidance, and clarity on CHIPS Act policy direction in Q1 2027.

WHEN TO BAIL: If MU guides HBM revenue DOWN on the next call, or if China export controls formally restrict HBM3E sales — those are the two "get out now" triggers. Also bail if stock breaks $580 on heavy volume (technical breakdown).

HEDGING: Simplest hedge — own slightly less MU and own some SOXX (the semi ETF) alongside. If you want to get fancier, buy some March $650 puts as insurance — they cost maybe 3-4% of your position but save you if the China shoe drops.
