TSLA: Cybertruck Dead, Robots & Robotaxi Are The Whole Story Now

WHAT HAPPENED

- Tesla bounced 4.76% today after getting absolutely crushed yesterday (-10.8%). The rebound is partly technical (oversold bounce) and partly because Musk officially killed the Cybertruck and pivoted the narrative hard to Optimus (humanoid robot) and Cybercab (robotaxi). Market is saying "ok, we'll give you credit for focusing" — but this week still wiped $420B in combined Tesla/SpaceX value.
- Chip stocks led a broader tech rebound, which gave TSLA cover. Options flow is wildly bullish near-term — someone bought 170K call contracts at the $360 strike, 26x the existing open interest. That's not retail; that's someone with a thesis.

WHY IT MATTERS

Killing the Cybertruck is an admission that Tesla's auto business is maturing and margins are under pressure — this is now officially an AI/robotics story, which is both exciting and terrifying because the valuation (~$1.4T) already prices in robotaxis working AND Optimus becoming a real product. The brutal 5-day selloff (-13% from Monday highs) tells you investors are starting to question the timeline, not the vision. The bounce today on heavy call buying suggests fast money is betting on a near-term catalyst — probably the Cybercab update Musk teased. Bottom line: you're no longer buying a car company, you're buying Elon's ability to execute on two moonshots at once, and that deserves a much bigger risk discount than the stock currently reflects.

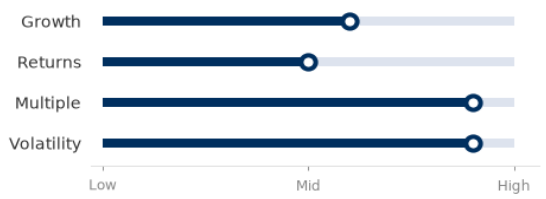

POLICY & POLITICAL WATCH

The single biggest policy lever for TSLA right now is federal autonomous vehicle rules — the Trump administration has signaled it wants a national AV framework to replace the state-by-state patchwork, which would be a MASSIVE unlock for robotaxi deployment (Tesla currently can't scale because every state has different rules). On the flip side, the $7,500 EV tax credit was killed earlier this year, which is already hurting demand — that's part of why the auto business is being de-emphasized. Watch for any NHTSA announcement on FSD (Full Self-Driving) approval frameworks; also watch China tariffs because Tesla's Shanghai gigafactory is a huge export hub and escalation hits them directly.

IS IT EXPENSIVE?

TSLA — Tesla, Inc. | November 06, 2026

PRICE OUTLOOK — SCENARIO TARGETS BY TIMEFRAME

TIMEFRAME	BULL CASE	BASE CASE	BEAR CASE
1 Month	**$395.00**	$365.00	**$310.00**
6 Months	**$460.00**	$380.00	**$280.00**
1 Year	**$520.00**	$420.00	**$260.00**
2 Years	**$650.00**	$450.00	**$220.00**
5 Years	**$900.00**	$550.00	**$180.00**
10 Years	**$1500.00**	$700.00	**$150.00**

WHAT'S MOVING IN THE SECTOR

HEATING UP: Semiconductors and AI infrastructure bouncing back today (+1.81% for tech) after a rough week — the market's appetite for AI risk isn't dead, just reset. Communication services up 5.68% on the week reflects rotation into more defensive growth.

COOLING OFF: Energy got absolutely wrecked (-11.64% over 5 days) on oil weakness, and tech overall is -7.90% on the week — the "AI bubble" chatter is back and the Fed's higher-for-longer rate stance is pressuring long-duration growth names like TSLA.

ROTATION WATCH: Money rotated violently OUT of mega-cap tech this week and into defensives/comm services. The bounce today looks like short covering more than conviction buying — be careful chasing it.

RELATED PLAY: If you believe the robotaxi thesis, NVDA (chips powering FSD) and MBLY (Mobileye, AV tech) are second-order plays with less binary risk than TSLA itself.

WHO'S WINNING IN THIS SPACE?

- NVDA (Nvidia): Still the cleanest AI infrastructure trade — benefits from every autonomy and robotics narrative, including Tesla's.
- GOOGL (Alphabet): Waymo is quietly scaling robotaxi miles faster than Tesla, and comm services sector is where money is hiding.

TSLA CONTEXT: Tesla is LAGGING its AI/tech peer group badly this week — down more than the Nasdaq and down more than other "AI story" stocks. That tells you the selloff was Tesla-specific (Cybertruck death, Musk focus questions), not just macro. Today's bounce is the market saying "ok, maybe we overdid it" — but until there's a real Robotaxi catalyst, expect it to lag.

WHAT I'D DO WITH THIS STOCK

5/10 Conviction Score

CONVICTION: 5/10 — I like the pivot to AI/robotics but the valuation gives you zero margin of safety; this is a hold, not a pound-the-table buy here.

POSITION SIZE: 2-4% max — the volatility is real (just saw a 13% drawdown in 4 days) and position sizing should reflect that you could get another one next week.

ENTRY POINTS: I'd wait for $320-340 — the 52-week low is $297 and macro tech selloffs tend to overshoot on TSLA specifically.

TIME HORIZON: 12-24 months — you're waiting for the Cybercab production milestone and federal AV rules; both are 2027 events.

WHEN TO BAIL: Cut it if Robotaxi gets pushed to 2028+, if Musk announces another major non-Tesla project, or if the stock breaks $280 on heavy volume.

HEDGING: Simplest hedge is just not oversizing it. If you want a real hedge, buy long-dated puts (6-month $300 strike) — think of it as insurance that costs 3-4% of your position value.
